```
The present invention describes a composition (I) comprising a substance that modulates the status of 11PIPI (gene and encoded protein), or a molecule that is modulated by 12IPIPI, where the status of a cell that expresses 12IPIPI is modulated. The human 12IPIPI gene maps to chromosome 49. (I) has cytostatic activity, and can be used in gene therapy, and in vaccines. The composition (I) can be used for diagnosing, preventing, prognosticating or treating patients with cancer that expresses 12IPIPI, such as breast, colon, ovarian or lung cancer. The 12IPIPI gene or its fragment can be used in active or passive immunisation. 12IPIPI antibodies can be used in active or passive immunisation. 12IPIPI polymucleotides are useful as probes and primers for the amplification or detection of 12IPIFI genes, as coding sequences for the amplification or expression of 12IPIFI polypeptides, or as tools for modulating or inhibiting the expression of 12IPIFI genes. The present sequence is used in the exemplification of 12IPIFI genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Composition comprising a substance that modulates the status of 121PIF1, useful in diagnosing, preventing, prognosticating or treating patients with cancer that expresses 121PIF1, such as breast, colon, ovarian or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              3

The invention relates to a secretory polynucleotide (designated sptm) comprising any of 567 polynucleotide sequences (AB25837-AB258403), a naturally occurring polynucleotide sequence at least 90 % identical to the polynucleotide sequence, a polynucleotide complementary to them or an RNA equivalent of them. The polypeptide or polynucleotide are useful for treating, preventing or diagnosing a disease or condition associated with the expression of functional SPTM. These are particularly useful for diagnosing, treating or preventing autoimmune/inflammatory disorders
                                                                                                                                     Human; SPIM; autoimmune disorder; inflammatory disorder; AIDS; anaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New human secretory proteins and polynucleotides, useful for diagnosing, treating or preventing autoimmune/inflammatory disorders (e.g. AIDS), neurological disorders (e.g. Alzheimer's), or cell proliferations or

The invention relates to human nucleic acids (AAIS7798-AAI61169) and the encoded polypeptides (AAM8642-AAM42213) with noctropic.

minunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as a peripheral nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral solevosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotectic/chemokinetic activity, haemostatic assays for receptor activity, arthritis and inflammation, leukaemias and thrombolytic activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form

The present invention describes a composition (I) comprising a substance that modulates the status of 121PIF1 (gene and encoded protein), or a molecule that is modulated by 12IPIF1, where the status of a cell that expresses 12IPIF1 is modulated. The human 12IPIF1 gene maps to chromosome 49. (I) has cytostatic activity, and can be used in gene therapy, and in vaccines. The composition (I) can be used for diagnosing, preventing, prognosticating or treating patients with cancer that expresses 12IPIF1, such as breast, colon, ovarian or lung cancer. The 12IPIF1 gene or its fragment can be usef to elicit a humoral or callular immune response. IPIFI antibodies can be useful as probes and primers for the amplification or detection of 12IPIF1 genes, as coding sequences for the amplification or detection of 12IPIF1 polypeptides, or as tools for modulating or inhibiting the expression of 12IPIF1 genes. The present sequence is used in the exemplification of 12IPIF1 genes. The present sequence is used
                                                                                                                                                                                                                          Composition comprising a substance that modulates the status of 121P1F1, useful in diagnosing, preventing, prognosticating or treating patients with cancer that expresses 121P1F1, such as breast, colon, ovarian or

The present invention describes a composition (I) comprising a substance that modulates the status of 121PlF1 (gene and encoded protein), or a molecule that is modulated by 121PlF1 (gene and encoded protein), or a molecule that is modulated. The human 121PlF1 gene maps to chromosome 4g. (I) has cytostatic activity, and can be used in gene therapy, and in vacines. The composition (I) can be used for diagnosing, preventing, prognosticating or treating patients with cancer that expresses 121PlF1, such as breast, colon, ovarian or lung cancer. The 121PlF1 gene or its cragment can be used to alicit a humoral or cellular immune response. In 121PlF1 antibodies can be used in active or passive immune response. Compression of 121PlF1 genes as coding sequences for the amplification or detection of 121PlF1 polypeptides, or as tools for modulating or inhibiting the expression of 121PlF1 genes. The present sequence is used in the exemplification of 121PlF1 genes. The present sequence is used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    165

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, concoded polypeptides (AAM38642-AAM42213) with nootropic, concoded polypeptides of the invention may be used to creat disease of the peripheral nervous injuries, contropathy and lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity, chemoteactic/chemokinetic activity, haemostatic, and thrombolypic activity, chemoteactic/chemokinetic activity, haemostatic, and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Wang D;

```
The present invention describes a composition (I) comprising a substance that modulates the status of 121PIF1 (gene and encoded protein), or a molecule that is modulated by 121PIF1, where the status of a cell that modulated the him of the status of a cell that expresses 121PIF1 is modulated. The human 121PIF1 gene maps to chromosome 4. (I) has cytostatic activity, and can be used in gene therapy, and in vaccines. The composition (I) can be used for diagnosing, preventing, such as breast, colon, ovarian or lung cancer. The 121PIF1 gene or its such as breast, colon, ovarian or lung cancer. The 121PIF1 gene or its plyII antibodies can be used in active or passive immunisation. 121PIF1 polynucleotides are useful as probes and primers for the amplification or detection of 121PIF1 genes as coding sequences for directing the capression of 121PIF1 polypeptides, or as tools for modulating or in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DCERIGTSNYYWAFPSKALHARKHKLEVLESQLSEGSQKHASLQKSIEKAKIGRCETEER 120

The present invention describes a composition (I) comprising a substance that modulates the status of 121PIFI (gene and encoded protein), or a molecule that is modulated by 121PIFI, where the status of a cell that expresses 121PIFI is modulated. The human 121PIFI gene maps to chromosome 4q. (I) has cytostatic activity, and can be used in gene therapy, and in vaccines. The composition (I) can be used for diagnosing, preventing, proposticating or treating patients with cancer that expresses 121PIFI, such as breast, colon, ovarian or lung cancer. The 12IPIFI gene or its fragment can be used to elicit a humoral or cellular immune response. 12IPIFI antibodies can be used in active or passive immunisation. 12IPIFI polypectides are useful as probes and primers for the amplification or detection of 121PIFI polypeptides, or as tools for modulating or inhibiting the expression of 121PIFI genes. The present sequence is used in the exemplification of the present invention.

The present invention describes a composition (I) comprising a substance that modulates the status of 121PIFI (gene and encoded protein), or a molecule that is modulated by 121PIFI (gene and encoded protein), or a molecule that is modulated. The human 121PIFI gene maps to chromosome 40. (I) has cytostatic activity, and can be used in gene therapy, and in vaccines. The composition (I) can be used for diagnosing, preventing, prognosticating patients with cancer that expresses 121PIFI, such as breast, colon, ovarian or lung cancer. The 121PIFI gene or its tragment can be used to elicit a humoral or cellular immune response. In 121PIFI antibodies can be used in active or passive immunisation. 121PIFI polymodiectides are useful as probes and primers for the amplification or detection of 121PIFI genes, as coding sequences for directing the capteresion of 121PIFI polypeptides; or as tools for modulating or inhibiting the expression of 121PIFI genes. The present sequence is used in the exemplification of the present invention. 9 Composition comprising a substance that modulates the status of 121PIF1, useful in diagnosing, preventing, prognosticating or treating patients with cancer that expresses 121PIF1, such as breast, colon, ovarian or 1 MSKKKGLSAEEKRTRMMEIFSETKDVFQLKDLEKIAPKEKGITAMSVKEVLQSLVDDGMV 3 1 MSKKKGLSAEEKRTRMMEIFSETKDVFQLKDLEKIAPKEKGITAMSVKEVLQSLVDDGMV 0; Gaps 9 Afar DEH, 121P1F1; 121P1F1 modulation; human; chromosome 4q; cytostatic; gene therapy; vaccine; cancer; immune response; immunisation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess blodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. Ag600010-AB630377 represent novel human diagnostic amino acid sequences. Ag600010-AB630377 represent novel human diagnostic parent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the inventions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            106

```
proteins are collectively known as colon cancer antigens. The colon cancer antigens have exposed activity and cancer antigens. The colon cancer antigens have exposed activity and cancer antigens have exposed activity and can be used in gene therapy cancer antigens have exposed activity and can be prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to cupplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 the AAH37204 and AAB37739 represent sequences used in the exemplification of the present invention. N.B. Pagenence of time of publication, meaning no sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cytostatic, antiarteriosclerotic, anticonvulsant; nootropic, antianginal;

This sequence represents a novel isolated human structural and cytoskeleton-associated protein (SCAP) polypeptide. The polypeptides and polynomidectides encoding them are useful in diagnosing, treating and preventing diseases or conditions associated with the decreased expression or over expression of SCAP, such as cell proliferative (e.g. cancer, atherosclerosis), neurological (e.g. epilepsy, Humington's disease, stroke), heart (e.g. hypertension, heart failure, angina) and skeletal muscle disorders (e.g. hypertension, heart failure, angina) and skeletal muscle disorders (e.g. hypertension, heart failure, angina) and skeletal muscle disorders (e.g. hypertension, osteoporosis, osteoporosis, compounds on the expression of nucleic acid and amino acid sequences of scape. The SCAP or its fragments are useful in screening compounds for effectiveness as agonist or antagonist of the polypeptides, or in altering the expression of the target polymucleotide and compounds that specifically bind to or modulate the activity of the polypeptide. The microarray is useful in monitoring or measuring protein-protein interactions, drug-target interactions, and gene expression profiles

ACF03547 to ACF03570 encode the human NOVX proteins (I) given in ABR57412 to ABR57455. (I) have cytostatic, cardiant, antiinflammatory, nootropic, immunosuppressive, antiallergic, haemostatic, anti-HIV, antidiabetic, antiarteriosclerotic, anorectic, antiaschmatic, nephrotropic, virucide, antiarthritic, hepatotropic, neuroprotective, antibacterial, relaxant, antipartulsant, hypotensive, vasotropic, antiparkinsonian, vulnerary, angiogenic antianthangiogenic activities, and can be used in gene therapy and vaccines. The NOVX polypeptides and their antibodies can be used to determine the presence or absence of (I) in a sample. The NOVX polypeptides, polymucleotides encoding them, and antibodies against them, are useful in manufacturing a medicament for treating or preventing a

encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymucleotides are useful in gene therapy. A composition containing a polymucleotide or polymucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sociences, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic as and thrombolytic activity, archeris and inflammation, leukaemias and carried activity, archeris and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form

The invention comprises the amino acid and coding sequences of human structural and cytoskeleton-associated proteins (SCAP). The SCAP DNA and protein sequences of the invention are useful for the diagnosis and treatment of: arteriosclerosis, atherosclerosis, cirrhosis, hepatitis, myelofibrosis, psoriasis, atherosclerosis cirrhosis, hepatitis, myelofibrosis, psoriasis, atherosclerosis, chronic bronchitis, rables, gastroenteritis, encephalitis, rubella, epilepsy, ischaemic cerebrovascular disease, stroke, cerebral neoplasm, Alzheimer's disease, pick's disease, Huntington's disease, dementia, Parkinson's disease, pick's disease, anyotrophic lateral selerosis, atrophy, hereditary ataxias, multiple sclerosis, meningitis, brain abscess, prion disease, Creutzfeldt-Jakob disease, insomnia, neurofibromatosis, cerebral palsy, myasthenia gravis, anxiety. The present amino acid sequence represents a human SCAP of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    :|:| | :|:| |::| |::| 45 AKEKILRVSEDERDRVILAABEAAAKABADVASINRRIQLVBEBLDRAQE 104

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          à
                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymucleotides are useful in gene therapy. A composition containing a polypeptide or polymucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous as peripheral nervous system, such as lathabites and central nervous system disease, such as lathabites and central nervous system disease, such as lathabiter of the activities and shy-brager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, activity, chemotexic/chemokinetic activity, haemostatic and thrombolytic activity, chemotexic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cone allele by insertion or replacement by a casestee having an expressible selectable marker and modifying other allele by promoter.

C promoter. So that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles modified are modified. The diploid fungal cells in which both alleles modified are useful for identifying a gene that is essential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus or contributes to the virulence and/or pathogenicity of a fungus and for identifying a therapeutic agent for treatment of a mammalian agent, an antifungal agent that inhibits the growth of a diploid fungus compound catabolism, blosynthetic, transporter, transcriptional, compound catabolism, blosynthetic, transporter, transcriptional, compound catabolism, blosynthetic, transporter, transcriptional, compound soluting growth or proliferation of C. albicans cells and for transing infection by C. albicans. The present sequence is that of an essential candida albicans protein used in the method of the invention. Note: The sequence data for this parent is not represented in the printed to be the printed the printed the printed the printed of the printed of the printed of the printed t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.

The invention useful in developmental biology and in elucidaring cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the princed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated nucleic acid detection reagent for detecting 1000 or more
genes from Drosophila and for elucidating cell signaling and cell-cell

(I), including antisense sequences and riboxymes, also proteins (II, ABB77424-ABB7745) encoded by them and antibodies specific for (II), are useful for diagnosis, monitoring and treatment of tumours, especially cutaneous T cell lymphoma (CTCL). (II) and antibodies to (II) are useful for vaccination. (II) can also be used to prepare pre-loaded antigen-presenting cells or tumour-specific T cells
                                                                                                                                            148

The mutein comprises a sequence of 976 amino acids fully defined in the specification (with the proviso that His at position 225 is replaced by Phe, and GJV at position 225 is replaced by Phe, and GJV at position 226 is replaced by Gln). The SCP-1 mutein is useful as a marker for cell transformation, for diagnosis and treatment of cancer and for screening substances which are immunoreactive and indicative of pathological conditions. The present sequence is the mutein of SCP-1 provided in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel nucleic acid molecule encoding a mutein of SCP-1, useful as a marker for cell transformation, and for identifying substances which are immunoreactive and indicative of pathological conditions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes an isolated epitope (I) and an epitope cluster. Also described is a vaccine or immunotherapettic composition (VC) comprising (I). (I) has cytostatic activity. VC is useful for treating an animal, by administering to an animal the vaccine or immunotherapettic composition. VC is also useful for evaluating communicity of a vaccine or immunotherapettic composition, by immunogenicity of a vaccine or immunotherapettic composition, by administering VC to an HLA-transgenic animal and evaluating immunogenicity based on a characteristic of the animal, or by in vitro primary stimulation of a T cell and evaluating immunogenicity. (I) is useful for determining specific T cell frequency, by contacting T cells with a MFC-peptide complex, and further comprises ELISPOT analysis, limiting dilution analysis, flow cytometry, in situ hybridisation and/or complexes chain reaction (PCR). Also disclosed is a vaccine or immunotherapeutic composition containing an epitcpe of the invention. Compositions of the invention may be used in the treatment of cancer. The method can be combined with a radiation therapy, chemocharapy biochemotherapy or surgery. The composition is also useful for evaluating

immunogenicity of a vaccine or immunotherapeutic compound. Multimeric MH-
peptide complexes of the invention are useful for determining specific
cell frequency. This method is useful for evaluating immunological
response, by performing the method prior to and subsequent to an
immunisation resp. Compositions of the invention are useful for
diagnosing a disease. The current sequence represents an epitope of the
invention with high affinity for MHC class I.

The invention describes a new isolated polypeptide (NOVX). The NOVX polypeptide, nucleic acid and antibody are useful as therapeutics, porticularly in the manufacture of a medicament for treating a syndrome associated with a human disease, which includes a pathology associated with NoVX polypeptide. The DNA encoding the protein is useful in gene the NOVX polypeptide or polymuclectide is useful for treating endocrine, polypeptide or polymuclectide is useful for treating endocrine, metabolism-related diseases (e.g. obssity or diabetes), central nervous system disorders (e.g. Alzheimer's disease, parkinson's disease, epilepsy, multiple sclerosis, schizophrenia or depression), autoimmune and inflammatory bowel disease, intermatorial architis or seteoarthritis), cancers (e.g. psoriasis, allergy, lupus erythematosus, catham, inflammatory bowel disease, intermatoid arthritis or seteoarthritis), cancers (e.g. colon, lung, liver, breast, ovarian, prostate or brain cancers, or melanoma), liver diseases (e.g. liver of infections, e.g. viral, bacterial or parasitic). These are also useful in developing powerful assay system for functional analysis of various human disorders, as well as in diagnostic analysis of various human human disorders, as well as in diagnostic analysis of various human disorders, as well as in diagnostic arials. This is the amino acid sequence of a novel human NOV protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      īŪ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Zhong M;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                invention.
```

The invention comprises the amino acid and coding sequences of human structural and cytoskeleton-associated proteins (SCAP). The SCAP DNA and protein sequences of the invention are useful for the diagnosis and treatment of: arteriosclerosis, atherosclerosis, cirrhosis, hepatitis, myelofibrosis, psoriasis, primary cancer, pneumonia, chronic bronchitis, myelofibrosis, psoriasis, primary cancer, pneumonia, chronic bronchitis, rables, gastroenteritis, encephalitis, rubella, epilepsy, ischeamic cerebrovascular disease, stroke, cerebral neoplasm, Alzhaimer's disease, pick's disease, prochic lateral sclerosis, atrophy, hereditary ataxias, multiple sclerosis, meningitis, brain abscess, prion disease, Creutzfeldt-Jakob disease, insomnia, neurofibromatosis, cerebral palsy, myasthenia gravis, anxiety. The present amino acid sequence represents a human SCAP of the

```

The invention relates to breast specific nucleic acids (BSNA) and breastspecific polypeptides (BSP). Also included are a method for determining
the BSNA in a sample, a vector comprising a BSNA, a host cell comprising
the vector, a method for producing a polypeptide encoded by a BSNA, an
anti-BSP antibody and a method for determining the presence of a BSP in
comprising them are useful for identifying, diagnosing, monitoring,
comprising them are useful for identifying, diagnosing, monitoring,
cancerous disease states in breast tissue; for identifying breast tissue;
comprising, identifying and/or designing agonists and antagonists of
the polypeptides; in gene therapy; in producing transgenic animals and
cells; for producing engineered breast tissue for treatment and research;
the polypeptides; in gene therapy; in producing transgenic animals and
cells; for producing engineered breast tissue for treatment and research;
the polypetides; the mucleic acids may be used as hybridisation
of breast disorders. The nucleic acids from, both genomic and transcriptand isolate hybridising nucleic acids from, both genomic and transcript
composition for raising an immune response against breast cancer. The
composition for raising an immune response against breast cancer. The
present sequence is BSP protein of the invention

New breast-specific nucleic acids and polypeptides, useful for identifying, diagnosing, monitoring, staging, imaging, and treating breast cancer and non-cancerous disease states in breast tissues.

The HCYT polypeptides can be expressed by standard recombinant methodology. The HCYT polypeptides, modulators and antibodies are useful for treating or preventing a disorder associated with decreased and increased expression or activity of HCYT in mammals. The polypeptides are also useful for disapposing HCYT activity disorders such as cell proliferative, immunological, reproductive, developmental and nervous disorders. Sequences AAY77569-576 represent HCYT polypeptides

                                                          The present invention relates to the genomic sequence of Pyrococcus abyssi (see AAF86431 and AAH41223-7) and P. abyssi proteins. P. abyssi is a hyperthermophilic archaeon, which is isolated from deepsea hydrothermal vents. The present sequence is one such P. abyssi protein. The proteins of the present invention have various potential industrial uses, since the proteins are stable at very high temperatures, some up to 110 degrees centigrade. Note: This patent is in the same patent family as WO200065062, which contains additional sequences as shown in AAB99132-AAB99143, AAH75903-AAH75920 and AAG66436

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a method (M1) for the staged assembly of a nanostructure using peptide nucleic acids (PNAs). M1 comprises: (a) contacting a nanostructure intermediate (NSI) having at least one unbound joining element (JE) with an assembly unit (AU) that comprises several different JE where: (i) none of these JE can interact with itself or other JE; and (ii) only one JE in AU and a single unbound JE in NSI are complementary, so that AU becomes non-covalently linked to NSI to produce a new NSI for us in subsequent cycles; (b) removing unbound AU; and (c) cyclic repetition of (a) and (b) to form a nanostructure. The new feature is that the complementary JE in at least one cycle are PNAs. Also is that the complementary JE in at least one cycle are PNAs. Also captined are nanostructures formed from many AU, comprising different JE, where at least one AU includes PNA. M1 is useful for producing nanostructures with a very wide range of potential applications, e.g. structural reinforcements (for aerogels, paper, plastics or cement, particularly as long fibres to improve tensile strength); identification (anti-counterfeiting) markers; enzyme or catalyst supports; assembly

                           for electron microscopy; molecular sieves and filters; substrates for optical and other surface coatings; scaffolds for solubilising enzymes or for trapping, protecting and delivering specific molecules; in high-density computer memories; as artificial zeolite for absorbing ions from water and for construction of new materials, including use in blosensors. PNAs are more homogeneous than inorganic nanoparticles generally used to form nanostructures, so will produce structures with predictable geometry and stoichiometry. The present sequence represents a procein containing coiled coil dimerisation sequences that can be used for structural elements of assembly units, given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ------KVIESRAQKDEEKMEIQEIQLKEA--KHIAEDADRKYE 163

The present invention describes a method (MI) for the staged assembly of a nanostructure using peptide nucleic acids (PNAs). MI comprises: (a) contacting a manostructure intermediate (NSI) having at least one unbound joining element (JE) with an assembly unit (AU) that comprises several different JE where: (i) none of these JE can interact with itself or comprehentary, so that AU becomes non-covalently linked to NSI for series of (a) and (b) to form a nanostructure. The new feature complementary, so that AU becomes non-covalently linked to NSI to produce a new NSI for us in subsequent cycles; (b) removing unbound AU; and (c) cyclic repetition of (a) and (b) to form a nanostructure. The new feature is that the complementary JE in at least one cycle are PNAs. Also described are nanostructures formed from many AU, comprising different JE, where at least one AU includes PNA. MI is useful for producing nanostructures with a very wide range of potential applications, e.g. structural reinforcements (for aerogels, paper, plastics or cement, particularly as long fibres to improve tensile strength); identification (anti-counterfeiting) markers; enzyme or catalyst supports; assembly scaffolds; for construction of nanowires or nanocircuits; size markers for the lectron microscopy; molecular sieves and filters; substrates for contraping, protecting and delivering specific molecules; in high-density computer memories; as artificial zeolite for solubilising enzymes or for trapping, protecting and delivering specific molecules; in high-density computer memories, as artificial zeolite for solubilising in manostructures, so will produce structures with predictable geometry and stoichiometry. The present sequence represents a protein containing colled coil dimerisation, sequence represents a protein containing colled coil dimerisation, sequence represents a protein containing colled coil dimerisation sequences that energy elements of elements of essembly units, given in the exemplification of the present elements of essembly sequ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 284 AA;

```
The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymerce cytokine in other cell populations. The polymerce is nother cell populations. The polypeptides are useful in gene therapy, vaccines or e.g. stem cell growth factor activity, immunomodulatory activities, activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or inflammation. Note: Records for SEQ ID NO 2110 (AAK5282) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication
                                                                                                                                                                                                                                                                                                                                               Nucleic acids encoding polypeptides with cytokine-like activities, useful in diagnosis and gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            124

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 4, Application US/09104324B

Patent No. 6232460

GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: Methods For Diagnosis And Treating Cancers,
TITLE OF INVENTION: And Methods For Identifying Pathogenic Markers In A Sample Of
TITLE OF INVENTION: No. 6232460mal Cells
NUMBER OF SEQUENCES:
ACMRESPONDENCE ADDRESS:
ADDRESSEE: Fulbright & Jaworski LLP
STREET: 666 Fifth Avenue
CITY: New York City
